

THERE'S ROOM FOR STEAM IN EVERY SHOWER

A BATHROOM REMODEL CHECKLIST

Sometimes what we don't know can scare us, especially when it comes to bathroom remodeling. So - before you hire the experts, such as a designer, contractor, plumber and electrician - check out our checklist to help you understand everything you need to know to install a home steam shower system.

Dreaming of a steam shower in your bathroom remodel but afraid your existing space might be too small? If your shower stall is at least 3x3 feet - and it's difficult to find one smaller than that! - you can install and enjoy the many benefits of steam in no time at all.

Of course, you might have a more spacious area to work with. One of the great things about steam is that you can go as big or as small as you like!

Once you review this 7-point checklist, you'll be ready to start building your steam shower wellness retreat with confidence!

Step 1. Selecting the Right-Sized Steam Shower Generator

The right-sized generator means you'll have the perfect amount of steam to fill your enclosed space. The best way to decide which generator size is right for you is to use [MrSteam's Virtual Spa](#) system on the MrSteam website.

Still worried about a very small bathroom? The size of the shower enclosure is really all that matters. The minimum size enclosure we recommend is **3'x3'x7'**. This gives you enough space to stand or sit on a **fold-up seat**.

But how do you know which size is right? It depends of two key factors:

- The size of your shower enclosure
- The type of material you use in that enclosure

First, measure the length, width, and height of your steam enclosure in feet:
LENGTH X WIDTH X HEIGHT = ROOM VOLUME in cubic feet.

Now, consider the construction materials you'll use:

- Natural marble, stone, glass block or concrete: add 110%
- The type of material you use in that enclosure
- Ceramic, porcelain or glass tile: add 40%
- Fiberglass and/or acrylic: deduct 15%

ROOM VOLUME + CONSTRUCTION MATERIALS = TOTAL ADJUSTED VOLUME

Either calculate the right sized generator yourself using our generator chart, or let our online Virtual Spa do the work for you.

CHECKLIST ITEM #1

Now that you know which generator you'll use, move on to Step 2.

Step 2. How High can the Steam Ceiling be?

How high can the steam ceiling be?

This one is easy! The ideal steam shower has a maximum ceiling height of 8 feet. If your bathroom has a higher ceiling or vaulted design, you may need a higher-rated and more powerful steam generator to fill the additional room volume.

The important thing to remember about ceiling height is that steam rises. If you design a room with a grandiose 13' ceiling, the laws of physics dictate that the steam will collect near the ceiling - over your head.

You can go higher than 8' - say up to 10' - but you'll need to bump up the size of the generator to compensate for that increased height.

CHECK ITEM #2

Now that you've measured the height of your bathroom ceiling, you're either fine with a standard generator or know you'll need to adjust it to a more powerful one if you exceed 8 feet. Move on to Step 3.

Step 3. Waterproofing and Sealing the Steam Shower Enclosure

It's important to make sure the enclosure is waterproofed, even the ceiling.

Here are some good options:

- A vapor barrier - a plastic or foil sheet used for damp proofing
- Hot mopping - asphalt and tar paper creating an impermeable layer
- A shower membrane - a pliable sheet-applied waterproofing membrane and vapor-retarder
- An underlayment - a rigid, light weight, waterproof backer board designed to easily hang on walls

Your shower needs to be properly enclosed so water vapor doesn't escape and lessen your steam experience. Glass shower doors and glass panels should reach all the way to the ceiling, while any windows in the shower should be double-paned.

Although the shower needs to be water-tight, it does not have to be airtight. Some air infiltration, especially around the shower door, produces the puffy white vapor that is so much a part of the steam experience.

For complete details on waterproofing go to [Tile Council of North America Steam Shower Installation](#).

CHECK ITEM #3

Now that you know how to keep the steam in, move on to Step 4.

Step 4. Pick the control that's right for you

MrSteam offers a full range of steamshower controls that caters to every consumer type. Our top-of-the-line controls push the technology and user envelope, making steam bathing a fully personalized experience.

MrSteam offers a full range of steamshower controls that caters to every consumer type. Our top-of-the-line controls push the technology and user envelope, making steam bathing a fully personalized experience.

Our more basic controls are pushbutton friendly, giving you the comfort and convenience of stepping into a steam shower without all the bells and whistles.

Of course, all of our controls offer these features:

- Controls temperature settings
- Works with all MrSteam eSeries Generators
- Works with SteamLinux to be able to set the control remotely
- Integrates with Amazon Alexa if SteamLinux is installed

Here's a quick description of all of the options.

iSteamX® - The sophisticated iSteamX combines WIFI connectivity + complete control over all features of your steam shower experience. Enjoy the bliss of a steam shower with your favorite playlist or podcast. Select chroma lighting, infuse aromatics and relax into complete tranquility. Carefully crafted from high-quality materials, the iSteamX features a sleek design that seamlessly blends with any shower space.

iTempoPlus® - the perfect control if two individuals in your household want to pre-set their time and temperature settings in a straightforward, less complicated steam shower control. In addition to supporting two users, iTempoPlus controls both AromaTherapy and ChromaSteam systems with an integrated on/off feature. **iTempo®** - The iTempo® control features a digital display, with adjustable temperature settings. This is the control to select if you want a great steam shower with push-button simplicity.

CHECKLIST ITEM #4

Now that you know the importance of a non-slip floor, move on to Step 5. Now that you have an idea about the range of controls you can choose from, move on to Step 5

Step 5. Where can you install your steam shower generator?

Here are some do's and don'ts to help you plan where to locate your steam shower generator:

DO INSTALL IT:

- In a closet, vanity cabinet, heated attic, or basement
- Within 60 feet of the steam shower
- In an upright position on a solid, level surface or mounted to a wall
- With clearance of at least 12 inches from the top and sides for servicing

DON'T INSTALL IT:

- Inside the steam shower enclosure
- Outside or anywhere that it might be affected by the environment
- In an unheated attic or anywhere that water might freeze
- Near flammable or corrosive materials or chemicals
- In areas with a high concentration of chlorine

CHECK ITEM #5

Now that you know where you might locate your steam generator, move on to Step 6.

Step 6. What are the Electrical Requirements Needed?

You'll need enough dedicated electric power to operate the generator and will want to work with a certified electrician. Unless you have your own electrician's license, MrSteam strongly discourages you from making this part of the project DIY!

So you'll know what to expect, here are the electrical requirements:

- If you live outside the US, consult with a licensed electrician.
- All of MrSteam's in-shower controls operate on low-voltage, separate from the generator.
- A separate, dedicated circuit breaker must be installed to power the steam generator.
- Place an easily accessed cutoff switch within sight of the steam generator.

CHECK ITEM #6

Now that you know enough to hire a certified electrician, move on to Step 7.

Step 7. Planning Ahead for the Steam Shower's Controls and Seating

You should locate the steam head approximately 12" above the floor on a wall opposite the seat, away from the entrance. A cool-to-the-touch steam head helps guarantee your comfort.

You'll want to decide the most convenient spot to control your steam experience. As a rule, keep the control between 4-5 feet above the floor and away from direct steam flow. MrSteam also offers remote control options that allows you to start up the steambath from anywhere.

To relax and fully embrace the benefits of steam, consider installing a seat. A fold-up seat helps maximize space. Otherwise, install a built-in bench, slightly sloped for drainage. Do make sure you locate the seat out of the direct path of the steam head!

CHECK ITEM #7

Now that you have a good idea of where to place the interior components of your steam shower, you're done!

Of course, there are other options you may want to consider – such as whether to add such amenities as [Aromatherapy](#), [Chromatherapy](#), [inshower lighting](#), and [audio](#). And the floor surface you choose is also important. Flooring needs to be textured to prevent falls. Or you may want to add anti-skid strips on your steam-room floor. But now you have a basic understanding of what it takes to remodel your existing shower – no matter how large or small. And you recognize that it’s a completely doable project, bringing you hours of personal enjoyment, enhancing your lifestyle and improving your wellbeing.

STILL HAVE QUESTIONS?

MrSteam offers you plenty of planning resources, such as live chat, the Virtual Spa sizing system, and the ability to locate an authorized MrSteam dealer in your area. Being well-informed about the process means you can now engage professionals – designers, builders, plumbers, and electricians – with the utmost confidence!
